# **Control valves**

# for floor heating systems

To be precise.

## **Description**

HEIMEIER supply pipe control valves and lockshields for heating manifolds are produced from corrosion resistant gunmetal in three different connection versions, specifically designed for installation on manifolds.

On the pipe side, the universal connection system offers the option of connecting plastic, copper, precision steel or multilayer pipes of different measurements with the compression fittings which have been developed for this type of pipe.

For HEIMEIER control valves, only use the appropriate, labelled HEIMEIER compression fittings (label e. g. 15 THE).

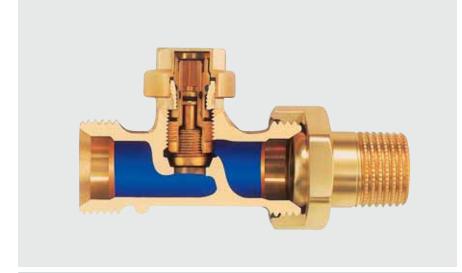

### **Assembly**

#### Supply pipe control valve

- Body made of corrosion-resistant gunmetal
- Stainless spindle with double O-ring sealing
- The outer O-ring and thermostatic insert can be replaced during operation
- Can be manually adjusted with a handwheel cap
- Thermostatic operation with thermostatic head F or with thermal and motorized actuators with the corresponding room thermostats
- Universal connection options on both sides

#### Lockshield

- Body made of corrosion-resistant gunmetal
- Finest presetting through a doublecone construction, no stroke restriction
- Spindle sealing by O-rings
- No change to the presetting when opening or closing
- Universal connection options on both sides

# **Application**

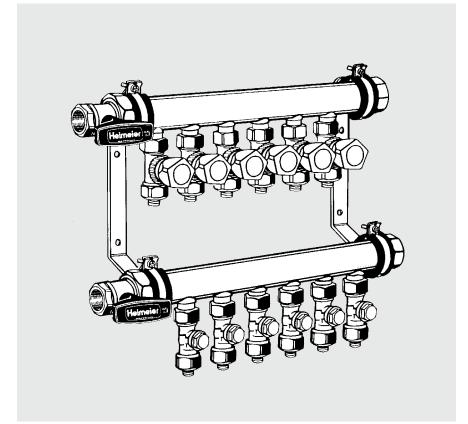

The supply pipe control valve is used

- Without a handwheel, for individual room temperature control with thermostatic head F, or with thermal and motorized actuators in connection with the appropriate room thermostats.
- With a handwheel, for manual operation. This model can be retrofitted to thermostatic individual room temperature control at low cost.

The hydraulic balancing of the heating circuits is carried out on the lockshields. Due to a special double cone construc-

tion, the presetting is not readjusted when the lockshield is opened or closed.

#### Sample application

Heating manifold

#### Note

The contents of the heat transfer medium should comply with VDI guideline 2035 to prevent damage and scale deposit formation in warm water heating systems. For industrial and long-distance energy systems, see the applicable codes VdTÜV 1466 and AGFW 5/15. A heat transfer medium containing mineral oils, or any type of lubricant containing mineral oil can have extremely negative effects on the source apparatus and usually leads to the disintegration of EPDM seals.

When using nitrite-free frost and corrosion-resistance solutions with an ethylene glycol base, pay close attention to the details outlined in the manufacturers' documentation, particularly details concerning concentration and specific additives.

 The thermostatic valve bodies can be used with all HEIMEIER thermostatic heads and thermal or motorized actuators. The optimal tuning of the components with each other guarantees the greatest possible safety.

When using actuators from other manufacturers, ensure that their pressure power in the closing area is adapted to thermostatic valve bodies with soft sealing valve discs.

#### Sample calculation 1

Target: Heating circuit 1 total pressure loss

Given: Heat flow, incl. floor loss = 1490 W Temperature spread = 8 K (44/36°C) Δt Heating pipe  $= 17 \times 2 \text{ mm}$ Pipe length incl. feed = 90 m

 $\frac{\dot{Q}}{2.4t} = \frac{1450}{1.163.8}$ Solution: Mass flow ṁ = 160 kg/h $c \cdot \Delta t$ 

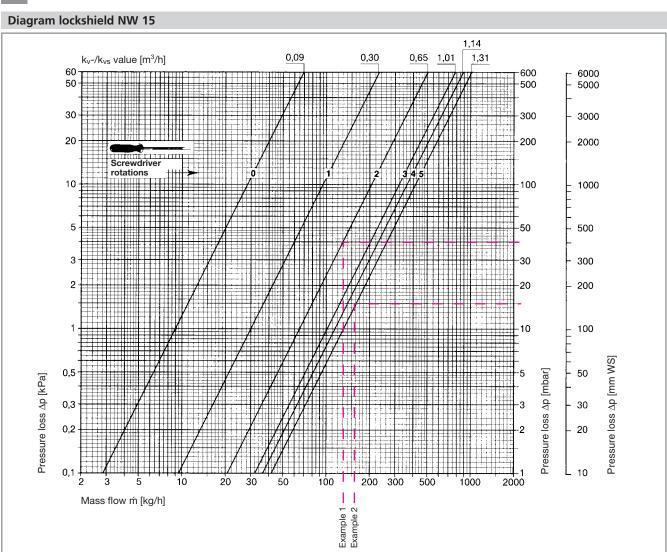

Pressure loss in supply pipe control valve  $\Delta \, p_{\nu}$ = 9 mbar

(with actuator) Pressure loss in the lockshield  $\Delta p_{RV} = 15 \text{ mbar (diagram, page 10)}$ 

(with open presetting) Pressure gradient in heating pipe = 1.2 mbar/m

 $\Delta p_R = R \cdot I = 1.2 \cdot 90 = 108 \text{ mbar}$ Pressure loss in the heating pipe Total pressure loss in the heating circuit 1  $\Delta p_{HK1} = \Delta p_V + \Delta p_{RV} + \Delta p_R = 132$  mbar Formula:  $C_{v} = \frac{k_{v}}{0.86}$  $k_v = C_v \cdot 0.86$ 

### **Technical data**

#### Sample calculation 2

Target: Presetting value for lockshield, heating circuit 2

(with handwheel)

Given: Heat flow, incl. floor loss  $\dot{\mathbf{Q}} = 1210 \ \mathrm{W}$ Temperature spread  $\Delta t = 8 \ \mathrm{K} \ (44/36^{\circ} \mathrm{C})$ Heating pipe  $\emptyset = 17 \ \mathrm{x} \ 2 \ \mathrm{mm}$ 

Pipe length incl. feed I = 86 m Pressure loss in the least  $\Delta p_{HK1} = 132$  mbar (example, page 9) efficient heating circuit

Solution: Mass flow  $\dot{m} = \frac{\dot{Q}}{c \cdot \Delta t} = \frac{1210}{1.163 \cdot 8} = 130 \text{ kg/h}$ 

Pressure loss in the supply pipe valve  $\Delta p_v = 6$  mbar (diagram, page 9)

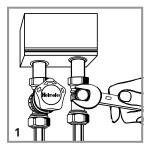

Pressure gradient in the heating pipe R = 1.0 mbar/mPressure loss in the heating pipe  $\Delta p_R = R \cdot I = 1.0 \cdot 86 = 86 \text{ mbar}$ 

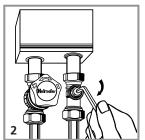

Pressure loss in the lockshield  $\Delta p_{RV} = \Delta p_{HK 1} - \Delta p_V - \Delta p_R = 40$  mbar Presetting, from the diagram = 2.0 turns

Formula:  $C_{V} = \frac{k_{V}}{0.86}$   $k_{V} = C_{V} \cdot 0.86$ 

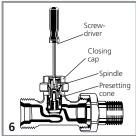

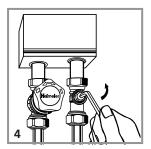

### **Operation**

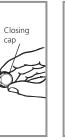

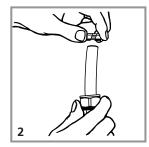

#### Lockshield

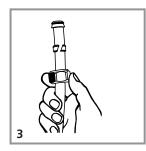

#### Presetting

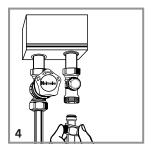

- **1.** Unscrew the closing cap with an open-jawed spanner SW 19.
- **2.** Close the spindle by turning it to the right with a 5 mm hexagonal key until it stops.
- **3.** Screw in the presetting cone with a 4 mm screw driver by turning it to the right until it stops (smallest setting value is 0). Set the required mass flow by turning the screw driver to the left. Take the setting value from the diagram.
- **4.** Open the spindle by turning it to the left with a 5 mm hexagonal key until it stops.
- **5.** Unscrew the closing cap and screw it tight with an open-jawed wrench SW 19.
- **6.** There will be no changes to the presetting when the lockshield is opened or closed.

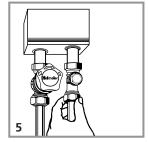

### **Installation**

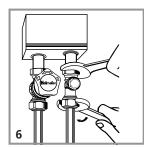

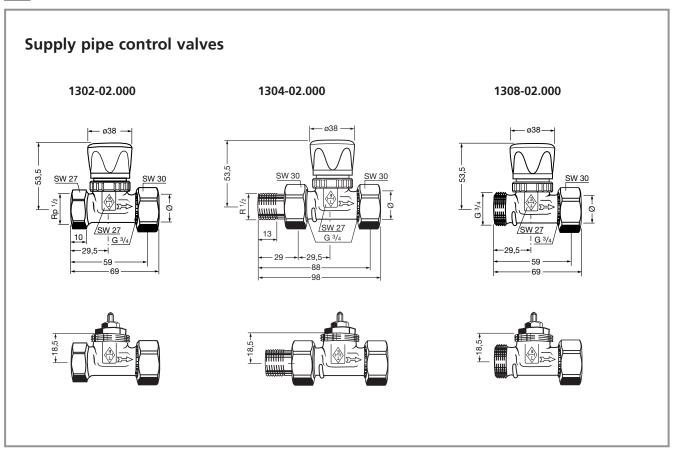

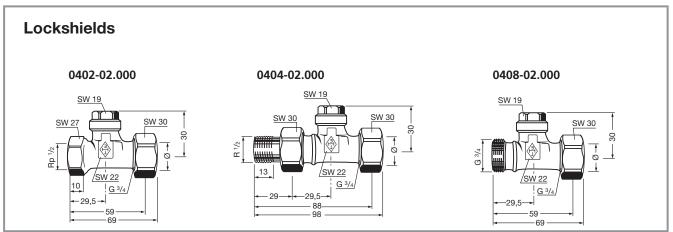

#### Plastic pipe

- **1.** Cut off the plastic pipe at right angles and trim. Push the compression ring nut over the pipe.
- 2. Pull the compression ring over the pipe.
- **3.** Position the hose nozzle and guide it while firmly holding the compression ring nut.
- **4.** Push back the inserts and the plastic pipe.
- **5.** Unscrew the compression ring nut by hand (push the plastic pipe until it stops).
- **6.** Hold control valve with open-jawed wrench SW 27 and pull it tight with open-jawed wrench SW 30 (starting torque experimental value approx. 25 30 Nm).
